jsUgrSession.jQuery.js

Methods

$().jsUgrLogin(function(data){});

   To be applied to a button. When clicked, the plugin searches for inputs
with classes "jsUgr user" and "jsUgr pass" and sends it's contents to the
server. Then it checks the server response and stores the username and
token recieved in cookies, that will be used later by jsUgrLogout. The
server response is also passed as an argument to the callback function. It
has the format {ok: *boolean*, user: *string*, token: *string*}.

$().jsUgrLogout(function(data){});

   To be applied to a button. When clicked, the plugin reads from the
cookies saved in the login process and sends them to the server in a logout
request. The return data can be accessed in the callback function and has
the format {ok: *true*} or {ok: *false*, error: *string*, reason: *string*}.

$().jsUgrCheck(function(data){});

   Can be applied to any element. Triggers on events *ready* and custom event
recheck. It is recommended to apply the method to $document so the check is
made when the page loads. When a recheck is required, it is enough to
trigger $(document).trigger('recheck').

Additional methods

   The file contains two additional methods to store and retrieve the
cookies.
